TURKISH UROLOGY ACADEMY

Female Uretra Strictures Reconstruction Course

February 14, 2020 - Sakarya University,
Faculty of Medicine

Female urethral strictures are relatively rare, but impair the quality of life and require significant experience in both diagnosis and treatment.

Traditionally, female urethral stricture disease is treated with dilatation or endoscopic techniques. However, stenosis often recurs with this treatment methods and urethroplasty is an inevitable treatment option, accordingly . In order to share current practices with our colleagues in the diagnosis and treatment of female urethral stricture, 'Female Urethral Stricture Diagnosis and Reconstruction Course' will be organized for the first time in our country on February 14, 2020 in accordance with the education and science policies of Turkish Academy of Urology. The course will be held with the participation of Dr. Jeremy Ockrim from University College London Hospital (UCLH), where reconstructive surgery is performed intensively in the treatment of female urethral stricture.

We are grateful for the sponsorship to Recordati Medicine, company who provides unrequited scientific support to the training.

We are looking forward to seeing you at the Central Campus of Sakarya University Training and Research Hospital on February 14, 2020
